Novel system for expressing protein of interest, has expression vectowith cassette having export protein coding sequence fused to protein coding sequence, host cell transformed with vector, and culturing

environment

Claim 5; Page 18; 33pp; English.

The present invention relates to a system for expressing a protein of interest. The system comprises an expression vector having an expression

cassette expresses the tor the transformed nost cell, where the expression cassette expresses the export protein-protein of interest fusion protein cassette expression vector. Which is exported out of the host cell. The system is useful for expressing agene in a bacterial cell, by providing an expression vector to a population of untransformed bacterial cells, and expressing the expression protein is produced and exported into the culture medium. The protein of interest is preferably an antigen and this method is useful for the interest is preferably an antigen and this method is useful for celiciting an immune response from a host against the fusion protein. CC (ClyA). The system is useful for the production of recombinant proteins (ClyA). The system is useful for the production of recombinant proteins (ClyA). The system is useful for the system is also useful for providing an animal antigenic material against which an immune response may be mounted. The obtained recombinant bacterium (e.g. Salmonalla) can be used as a live vector immunogenic composition capable of facilitating the generation of an immune response in an animal. The system is also useful for preparing immunogenic compositions for vaccinating animals, and for use in the food, nutritional supplement, animal feed, and for use in the food, nutritional supplement, animal feed, to host bacterium can also be expression vector, and then the combinant host cells can be transformed with the expression vector, and then the population of bacterial host cells can be maintained in culture and used to produce protein swithout having to harvest and lyse the host cells. The present represents salmonella typhi ClyA protein coding sequence genetically fused to a DNA sequence encoding the protein of interest, a host cell transformed with the expression vector, and a culturing environment for the transformed host cell, where the expression cassette, where the expression cassette comprises an export protein

WPI; 2003-228013/22. N-PSDB; ABX15191 Novel system for expressing protein of interest, has expression vector with cassette having export protein coding sequence fused to protein coding sequence, host cell transformed with vector, and culturing

Example 3; Page 25-28; 33pp; English.

Conting present Inventor Federa to a system for expressing a protein of interest. The system comprises an expression vector having an expression cassette comprises an export protein coding sequence genetically fused to a DNA sequence encoding the protein of interest, a host cell transformed with the expression vector, and a culturing environment for the transformed host cell, where the expression cassette expresses the export protein-protein of interest fusion protein cassette expresses the exported cell. The system is useful for expression a gene in a bacterial cell. By providing an expression vector cassette, such that the export protein-protein of interest their protein is produced and exported into the culture medium. The export protein in grade and exported into the culture medium. The export protein in grade and exported into the culture medium. The export protein may be a member of the HIMP family such as cytolysin A (ClyA). The system is useful for the production of recombinant proteins for the production of recombinant proteins can be used as a name of bacteria. The system is also useful for the production of recombinant proteins may be mounted. The obtainant bacterial against which an immune response composition capable of facilitating an alimal antigent excembinant bacterium of an immune response in an animal. The system is also useful for use in the food, nutritional supplement, animal feed, blomediation, waste disposal, and waste treatment industries. The system is very advantageous for protein expressed. A population of recombinant host cells can be transformed with the expression vector, and then the copulation of bacterial mediation, as proteins without having to harvest and lyse the host cells. The present sequence represents Salmonella typhi ClyA, as a fusion contract to export heterologous antigens out of S. typhi present invention relates to a system for expressing a protein of

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food
New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                 Claim 20; SEQ ID NO 55580; 103pp; English

supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences in the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to new Proteus mirabilis polypeptides and polynucleotides. The invention also relates to antibodies against the polypeptides, amethod for producing the polypeptides, amethod of penerating vaccines for immunising an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polynucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial drugs or as bio-control agents for plants. This sequence represents a proteus mirabilis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                             53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibacterial; virucide; fungicide; protozoacide; cytostatic; anti-HIV; hyperimmune; serum-reactive; antigen; pathogen; tumour; allergen; auto-immunity; vaccine; staphylococcal infection; antibody; cancer; autoimmune disease; HIV; hepatitis.

producing hyperimmune serum-reactive antigens from a pathogen, tumour, allergen, a tissue or host prone to auto-immunity, where the antigens are used in a vaccine, comprises providing antibody preparation from a plasma pool of a type of animal, or individual sera with antibodies against the specific pathogen, tumour, allergen, tissue or host prone to auto-immunity. The hyperimmune serum-reactive antigens comprising any of the care sequences of 53-2261 amino acids fully defined in the specification, or their hyperimmune fragments are useful for the manufacture of a parameterical preparation, particularly a vaccine against staphylococcal infections or colonisation against S. aureus or S. epidermidis. The preparation of antibodies is useful for the manufacture of a medicament for treating or preventing staphylococcal infections or colonisation against S. aureus or S. epidermidis at the antibody preparation may also be used for diagnostic and imaging purposes other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This sequence represents a staphylococcal protein relating to the method for identifying and producing pathogen specific antigens of the invention
                                                                                                                                                                                                           Identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, for preparing vaccine or medicament for treating or preventing e.g. staphylococcal infections, comprises providing antibody

```

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. cecombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-ended toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence are containing targets of human diseases for which P. Luminescens is a model (particularly plaque and whooping cough). This sequence represents one of the isolated P. luminescens

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS707). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                            Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; SEQ ID NO 40632; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid derived from
Enterococcus faecium encoding an Enterococcus faecium polypeptide having
Enterococcus faecium encoding an Enterococcus faecium polypeptide having
Composition of 10 fully defined sequences given in the (or comprising 40
sequential nucleotides chosen from any of the nucleic acids, its
complement or sequences hybridising to it. Also included are a
recombinant vector comprising the nucleic acid operably linked to
transcription regulatory element, a cell comprising the vector and
transcription regulatory element, a cell comprising the vector and
transcription and eroperable sequences encoding 3654 disclosed proteins.
Chosen from 3654 disclosed sequences encoding 3654 disclosed proteins.
The nucleic acids is useful for diagnosing pathological conditions
resulting from E. faecium bacterial infection (e.g. urinary tract
infection, bacteraemia, endocarditis, wounds and abdominal-pelvic
infection, and for screening drugs such as agonists and antagonists. The
uncleic acid is useful for recombinant production of Candida albicans -
                                                                                                                                                               -----SQINSLIELKNVPEVRNLTKTSIRKLSFL 482

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expensable selectable marker and modifying other allele by promoter. So that expression of the second allele is regulated by the promoter. So that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a fungus and for identifying a therapeutic agent for treatment of a mammalian agent, an autifungal agent that inhibits the growth of a mammalian compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, compound actabolism, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans repeated sequence is that of an essential Candida albicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed contribution by the present sequence information supplied to Derwent by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1444 KTLKSTREELNGSKTEILR-----LKALLRESEDELYQVKQENYKTSVHDYEQDLAQ 1495

The invention relates to an isolated nucleic acid comprising any one of the foll antiesnes sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: of the nucleic acid inhibits proliferation of a cell. Also included are: comprising a promoter operably linked to the nucleic acid (1) a vector comprising a pronoter operably linked to the nucleic acid (2) a host cell containing the vector; (3) an isolated conclain acid; (2) a host cell containing the vector; (3) an isolated conclain acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding contines nucleic acid; (4) an antibody capable of specifically binding contines nucleic; (5) producing the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular poliferation; (7) identifying a compound that inhibits cellular proliferation; (8) cequired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the servent or compound; a activity; (11) a culture comprise or compound that inhibits the strent or compound; a activity; (11) a culture comprise or compound that inhibits the strent or continers or of the strains is present in a culture or collection of an organism. The antisense nucleic acids are useful for contineration of an organism. The antisense nucleic acids required contined and actional actional activity; (10) and organism or screening for homologous nucleic acids required for cellular proliferation or for arranging and antisense nucleic acids required contined and actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional actional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LVGDIKVLLMDSQDKXFEATQTVYEWC-------GVVTQLLSAYILLFDEYNE 106
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       223 MEQSDVIVTVSDIDHYTEDNQRLDERLINHLKSQQAEKEGQQAQINQLLQRY----- 273

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid concoling a polypeptide whose expression is inhibited by the antisense conclair acid; (2) a host cell containing the vector; (3) an isolated contisense nucleic acid; (4) an antibody capable of specifically binding configeration or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway or a gene product for cellular proliferation or the biological identifying a gene required for cellular proliferation or the biological corresponding and activity against a biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of a strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated containing the vector; (3) an isolated polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required by the activity of proliferation or that has an activity against a biological pathway required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation, or that inhibits cellular proliferation of an orangement of an activity; (10) profiling a gene required for cellular proliferation of an orangement of an activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of a compound; a activity; (11) a culture comprising strains in which the test compound that inhibits a proliferation of a compound; a activity; (11) a culture comprising strains in which the test compound that inhibits the proliferation of an ordanism. The antisense nucleic acids are useful for the which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation in cells other than S. aureus, S. typhimurium, C. cequired for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence is encoded by one of the target prokaryotic format directly from NIPO at collection, but was obtained the collection of the collection of the printed specification.

The invention relates to an isolateu nucleic acts ustrives them.

Entercoccus faccium encoding an Entercoccus faccium polypeptical concoccus faccium polypeptical concoccus faccium polypeptical concoccus faccium polypeptical concoccus faccium polypeptical concoccus faccium concoccus faccium concoccus faccium comprising 40

complement or sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acid operably linked to recombinant vector comprising the nucleic acid operably linked to recombinant vector comprising the nucleic acid. The nucleic acids are single-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions. The nucleic acid is useful for diagnosing pathological conditions and for screening drugs such as agonists and antagonists. The infection, bactersemia, endocarditis, wounds and abdominal-pelvic infection, and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans and vaccines containing the nucleic acid are useful for preventing or treating Entercoccus faccium infections. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     149 LALDSQLTNDFSEKSSYFQSQ-----VDRIR-----KEAYAGAAAGIVA--GPFGLII 194

The sequence is that encoded by a cDNA clone encoding the hyaluronan receptor (HARC). The sequence was obtd. by screening a 3T3 library in creeptor (HARC). The sequence was obtd. by screening a 3T3 library in clambda gill with antibodies to HARC. A clone of 1.9 kb was obtained and land to rescreen the library to obtain the full length, 2.9 kb clone. HA is dead to rescreen the library to obtain the full length, 2.9 kb clone. HA consider the library normal cells and is only expressed in stitutions where cell motility is desired, e.g. in wound healing, in cresponse to growth factors and in chemoteaxis by white blood cells. HA may compose to growth factors and in chemoteaxis by white blood cells. HA may compose to growth factors and in chemoteaxis by white and chronic clocomotion, e.g. tumour invasion, birth defects, acute and chronic clocomotion, e.g. tumour invasion, birth defects, acute and chronic clocomotion, e.g. tumour invasion, birth defects, acute and chronic course, surgical incisions and adhesions, strokes, multiple sclerosis, burns, surgical incisions and adhesions, strokes, multiple sclerosis, involving nerve sprouting; also in CNJ and spinal cord regeneration, invitro fertilisation and embryo development. See also contraception, in vitro fertilisation and embryo development. See also on 25-MAR-2003 to correct PN field.)

This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention

The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of

This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases
                                                                                                      12;

associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity, and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention

                                   The invention relates to diagnosing or prognosticating a neurodegenerative disease in a subject, or determining whether a subject is at increased risk of developing the disease. The method involves determining a level and/or an activity of a transcription or translation product of a gene coding for golgin-245 and/or a fragment, derivative or variant in a sample from the subject and comparing the level and/or the activity to a reference value. The composition and methods are useful in diagnosing, preventing and/or treating neurodegenerative disease, such as Alzheimer's disease, Parkinson's disease, Huntington's disease, such as Alzheimer's disease, Parkinson's disease, Huntington's disease or amyotrophic lateral sclerosis. The recombinant, non-human animal is useful for screening, testing and validating compounds, agents and modulators in the development of diagnostics and therapeutics to treat neurodegenerative diseases, in particular Alzheimer's disease. Specific antibodies are used for detecting the pathological state of a cell in a sample from a subject. The present sequence represents a human golgin-245 splice variant 1 polypeptide

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially regulated in the sample comprises to prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Of target genes which are differentially-regulated in prostate cancer cells with a test agent that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells with a test agent that conditions effective for the test agent to modulate a biological activity of the polypeptide, and cetermining whether the test agent modulates the biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, or products are used in the diagnostic test to assay for presence of cancer. Or products are used in the diagnostic test to assay for presence of cancer. (I) is useful for an also be used for expressing the polypeptide and thus to be oblogated etc. (I) is useful for an also be used for expressing the polypeptide and thus to the polypeptide end advanced for expressing the polypeptide and thus of specific genes, and groups of genes, expressed in pathways for presence of the polypeptide and thus to the polypeptide and discovery. (I) can also be used for expressing the polypeptide and thus of specific genes, and groups of genes, expressed in pathways and the delineation of targets in these pharmary which are useful in disease pathways and cellenged in pathways and cellenged in the delineated and disease pathways and educated and educated and educated and disease pathways and educated and educated and educate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1011 SAGISDAVSRLETNÖKEQIESLTEVHRRELNDVISIWEKKLNQQAEELOEIHEIQLQEKE 1070
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SVLVGDIKVLIMDSQDKYFBATQTVY--EWCGVVT------QLLSAYILLFDEYN 105

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to diagnosing or prognosticating a neurodegenerative disease in a subject, or determining whether a subject is at increased risk of developing the disease. The method involves determining a level and/or an activity of a transcription or translation product of a gene coding for golghn-245 and/or a fragment, derivative or product of a gene coding for golghn-245 and/or a fragment, derivative or variant in a sample from the subject and comparing the level and/or the cativity to a reference value. The composition and methods are useful in diagnosing, preventing and/or treating neurodegenerative disease, such as Alzheimer's disease, Parkinson's disease, Huntington's disease or any angertophic lateral sclerosis. The recombinant, non-human animal is useful for screening, testing and validating compounds, agents and modulators in the development of diagnostics and therapeutics to treat neurodegenerative diseases. In particular Alzheimer's disease. Specific neurodegenerative desease, in particular Alzheimer's disease. Specific neurodegenerative desease, in particular Alzheimer's disease. Specific sample from a subject. The present sequence represents a human golgin-245 sample covariant 2 polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                  The invention relates to diagnosing or prognosticating a neurodegenerative disease in a subject, or determining whether a subject is at increased risk of developing the disease. The method involves determining a level and/or an activity of a transcription or translation product of a gene coding for golgin-245 and/or a fragment, derivative or variant in a sample from the subject and comparing the level and/or the activity to a reference value. The composition and methods are useful in diagnosing, preventing and/or treating neurodegenerative diseases, such as Alzheimer's disease, Parkinson's disease, Huntington's disease or amyotrophic lateral sclerosis. The recombinant, non-human animal is useful for screening, testing and validating compounds, agents and modulators in the development of diagnostics and therapeutics to treat methodsenerative diseases, in particular Alzheimer's disease. Specific antibodies are used for detecting the pathological state of a cell in a sample from a subject. The present sequence represents a human golgin-245 splice variant 3 polypeptide

The invention relates to diagnosing or prognosticating a neurodegenerative disease in a subject, or determining whether a subject is at increased risk of developing the disease. The method involves determining a level and/or an activity of a transcription or translation product of a gene coding for golgin-245 and/or a fragment, derivative or convariant in a sample from the subject and comparing the level and/or the activity to a reference value. The composition and methods are useful in diagnosing, preventing and/or treating neurodegenerative disease, such a Alzheimer's disease, Parkinson's disease, Muntington's disease or amyotrophic lateral sclerosis. The recombinant, non-human animal is useful for screening, testing and validating compounds, agents and methodics in the development of diagnostics and therappeutics to treat neurodegenerative diseases, in particular Alzheimer's disease. Specific antibodies are used for detecting the pathological state of a cell in a sample from a subject. The present sequence represents a human golgin-245 and in a sample from a subject and a control or services.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          106 EKKASAQKDILI------RILDDGVKK---LNEAQKSLLTSSQSFNNASGKLL 149

The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAP66431 and AAH41223-7) and P. abyssi proceins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MTSIFAEQTVEVVKSA--IETADGALDLYNKYLDQVIPWKTFDETIKELSRFKQEYSQEA 58

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pethway required for that has an activity against a biological pethway in which a proliferation-required gene or the biological pethway in which a proliferation-required gene or the biological pethway in which a proliferation-required gene or the biological pethway in which a proliferation-required gene or the biological pethway in which a proliferation-required gene or the proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity, (11) a culture comprise selection of an organism acts of the strains is present in a culture or collection of an organism. The antisense nucleic acids required for proliferation in cells of nompologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimizing captured for proliferation in cells other than S. aureus, S. typhimized of the target prokaryotic essential genes in sequence data for this charged processed or accenting for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimized or P. aeruginose. The present sequence is encoded by one of the target prokaryotic essential genes not sequence acuence of a patent did not form part of the present sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     18 ETADGALDLYNKYLDQVIPWKTFDETIKELSRFKQEYSQEASVLVGDIKVLLMDSQDKYF 77

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIJ6176-ABIJ3611), expressed DNA sequences (ABIJ6175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly

BimC is a kinesin related protein, which is essential for fungal viability. The specification describes a method of identifying modulators of bimC. The method comprises adding a test agent to a mixture comprising bimC protein that directly or indirectly produces ADP or phosphate, subjecting the mixture to an enzymatic reaction that uses the ADP or phosphate, and determining the enzymatic activity in presence and absence of test

compound. A change in the activity level between the presence and absent of the candidate agent indicates a modulator of the target protein function. The method is useful for identifying a modulator, e.g. antifungal agents, of bimc. The modulators can be used, for example, to inhibit the growth or spread of fungi, mould, fruit files, etc. . The modulators can be used for preventing and treating infections caused by Chytridiomycetes, Hyphochrytridiomycetes, Plasmodiophoromycetes, competes, and Basidiomycetes

The invention relates to a kit for screening for modulators of bimC, comprises a biologically active bimC (a kinesin related protein essential for mitosis), its fragment or homologue, and instructions for testing bimC activity. The kit is used for screening for modulators of bimC. The kit is also useful for identifying therapeutic agents (antifungal agents against Candida infections, fusaria infections, sygomycosis, cryptococcosis and histoplasmosis) and agricultural compounds. The present sequence represents the fruitfly bimC homologue, KLP61

The invention relates to a candidate agent that binds to a target protein. Identification of a candidate agent as a modulator of function of a target protein involves adding the candidate agent to a mixture comprising the target protein that directly or indirectly produces adenosine diphosphate (ADP) or phosphate, subjecting the mixture to an allow the production of ADP or phosphate under conditions which normally allow the ADP or phosphate as a substrate under conditions which normally allow the ADP or phosphate to be utilised, and determining the level of activity of the enzymatic reaction where a conditions which normally allow the ADP or phosphate to be utilised, and determining the level of activity of the enzymatic reaction where a conditions which normally allow the ADP or phosphate to be utilised, and determining the level of activity of the enzymatic reaction where a gent indicates modulation of the target protein. The method provides a high throughput system for target protein. The method provides a high throughput system for detecting modulators of blmC enzyme activity. This sequence represents the fruit fly KLDel polypeptide, which is a homologue of the kinesin related protein (KRP) bimC, a target protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ----AGIVAGPFGL----IISYSIAAGVIEGKLIPELNNRL--KTVQNFFTSLSATVK 230

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid of a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide; (5) producing the polypeptide; (3) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for completed for that has an activity against a biological pathway in which a proliferation, or that thibits cellular proliferation; (8) required for proliferation, or that thibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the servent comprising strains in which the strains is present in a culture or collection of a compound a activity; (11) a culture comprising strains in which the strains is present in a culture or collection of compound's activity; (11) a culture comprising strains in which the strains or (13) identifying the target of a compound that inhibits the collection of an organism. The antisense mucleic acids are useful for proliferation of an organism. The antisense mucleic acids are useful for cellular proliferation in cells other than S. aureus, S. typhimurium, argument discorpty programs, or for serventnessed candidate molecules for proliferation in cells other than S. aureus, S. typhimurium, and the argument of the printed specification, but was obtained in electronic control of the present sequence are sequenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      59 SVLVGDIKVLLM-----DSQDKYFEATQTVYEWCGVVTQLLSAYILLFDEYNEKKASA 111

The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   728 NHEATTEEÖNEAIROVEAHSSDÄLAKIGE------AETDTTVNEAR 767

The method is useful for improving gene targeting efficiency. The method is useful in the replacement of an active gene by an inactive gene, for e.g. for the inactivation of genes controlling undesired side branches of metabolic pathways, to increase the quality of bulk products such as starch, or to increase the production of specific secondary metabolites or to inhibit formation of unwanted metabolites, and also to inactive genes or to inhibit formation of unwanted metabolites, and also to inactive genes controlling senescence in fruits and flowers or that determine flowers or the determine by an active gene. For e.g. the replacement of a defective p53 by an intact p53. Many tumours acquire a mutation in p53 during their development which renders it inactive and often correlates with a poor response to cancer therapy. By replacing the defect p53 by an intact p53.

C e.g. through gene therapy, conventional anti cancer therapy have better changes of succeeding. The method is also useful for therapeutic changes of succeeding. The method is also useful for therapeutic concer therapy as substance integration. A tumoricial gene can be delivered to a pre-determined site present only in e.g. proliferating cells, or present only in tumour cells, e.g. to the site where a tumour antigen is expressed form. ABB77984-86 represent RADSO homologues. RADSO is involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a method for directing integration of a nucleic acid of interest to a pre-determined site, where the nucleic acid has homology at or around the pre-determined site, in a eukaryote with a preference for non-homologous recombination. The method comprises steering an integration pathway towards homologous recombination. The method is useful for directing integration of a nucleic acid of interest or a subtractomaric and/or telometric region in an eukaryote with a preference for non-homologous recombination. The nucleic acid of interest comprises an inactive gene to replace an active gene, or vice versa, is a portion of a gene delivery vehicle, confers a desired property to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EQLHTYKGQVKTLNLSRDQLENALKENEKSWSSQKESLLEQLDLSNSRIEDLSSQNKLLY 1121
                                                                                                                                                                                                                                                                                                                                  The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC6610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information upplied by the Buropean Patent Office. The complete

The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that the specification. The variants are encoded by nucleic acids that thybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are useful as targets for an active conditions. The protein complexes are useful as targets for an active cuseful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or correcting for the presence of a disease or disorder or a predisposition of sortering for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament or prevention of a disease or disorder. This sequence of corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was for corporatine from the EPO in electronic formath).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                     ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from the USPTO web site

The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.
monocytogenes and related organisms, and for studying genetic
color polymorphisms and other genomes. The present sequence is a protein
expensed from the genome sequence of the present invention. Proteins
expressed from the genome sequence are useful for raising specific
antibodies, identification of L. monocytogenes and related organisms, and
for blosynthesis and biodegradation, especially biosynthesis of vitamin
constructions that regulate gene expression and cell replication
and modulate L. monocytogenes related diseases. In addition, the genome
sequence and proteins encoded by it are useful in pharmaceutical and
vectines compositions for the treatment or prevention of infections by L.
monocytogenes and related organisms. Note: The sequence data for this
monocytogenes and related organisms. Note: The sequence data for this
content of not form part of the printed specification, but was obtained
in electronic format directly from WIPO at

```
The present sequence represents a human homologue of the yeast S. cerevisiae gene RAD50. The present sequence has 35% overall homology to the yeast RAD50 gene, and is expressed in activated T-cells, testis, foctal liver and heart tissues. The specification also describes sequences encoding human homologues of the yeast RAD50, the Drosophila Septin-2 and Acyl-CoA synthetase. The proteins have immunomodulatory activity. The nucleic acids and proteins can be used to identify activated T-cells in a sample population. They can also be used to isolate and identify sequences encoding other proteins or other compounds isolate and identify sequences encoding other proteins or other compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel human immunomodulatory poly:peptide(s) - have homology to the yeast RAD50 or Drosophila Septin-2 proteins.

Also disclosed in this invention is Human septin-2 homologues of which may be used as targets for cancer therapies and central nervous system directed treatment methods, and to measure the proliferative potential of selected cell types
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SQEASVLVGDIKVLLMDSQDKXFEATQTVYEWCGVVTQLLSAYILLFDEYNEKKASAQKD 114

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  solated nucleic acid detection reagent for detecting 1000 or more from Drosophila and for elucidating cell signaling and cell-cell

discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABR72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

sequences which encode them. In particular, the genes are derived from Lactobacillus johnsonii. The invention may allow a better understanding of the mechanism by which probiotics (such as L johnsonii) can bind to mucins, large glycoprotesins present on the surface of a large number of epithelial cells including those in the gastrointestinal tract, the lung or the uterine cervix. The present sequence is that of an L johnsonii mucin binding protein of the invention.
                                                                                                                                                                                       --KYLDQV-----IPWK 38

                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insectioides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176, ABL30511), expressed DNA sequences (ABL16176, and the encoded proteins (ABB57737-Sequences (ABC)2072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA BBC2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                  detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated Acinetobacter baumannii nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9 TVEVVKSAIETADGALDLYNKYLDQVIPWKTFDETIKELSRFKQ--EYSQEASVLVGDIK

The present invention describes an isolateu polymucieculue (1), oct.

Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.

Alloiococcus otitidis is a Gram-poslitive bacterium. Also described: (1)

Alloiococcus otitidis is a Gram-poslitive bacterium. Also described: (1)

an isolated polypeptide that is encoded by the polymucleotide (1), its expression vector comprising the novel isolated polymucleotide (1), its complement, degenerate variant or fragment; (3) a genetically engineered composition comprising the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide, its complement, biological cquivalent or fragment, or the polymucleotide that is comprised in the expression vector; (6) a pharmaceutical composition comprising the expression vector; (6) a pharmaceutical composition comprising an array of the polymeptide of (1), their biological equivalent or fragment, of the polymeptide of (1), their biological equivalent or fragment, of immunising against Alloiococcus otitidis by administering to a host the immunogenic composition; (9) detecting and/or identifying Alloiococcus cultidis in the biological sample; (10) a kit comprising a container or the antibody of (4); and (11) producing a polymeptide by culturing the containing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polymeptide by culturing the polymucleotides, polymeptides, antibodies and compositions of the present composition and be used for treating and diagnoshing diseases, frugal trials. The polymucleotides are useful for expressing and detecting Alloiococcus otitidis. The present sequence represents an Alloiococcus otitidis antigen protein from the present invention.
                                                                                                                                                                                                                                                                                                                 New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present invention describes an isolated

The specification describes a method for directing integration of a nucleic acid of interest to a pre-determined site, where the mucleic acid has homology at or around the pre-determined site, in a eukaryote with a preference for non-homologous recombination. The method comprises compared is useful for directing integration of a nucleic acid of interest to a subtelomeric and/or telomeric region in an eukaryote with a to a methologous recombination. The mucleic acid of interest comprises an inactive gene for replace an active gene, or vice versa, is a comprises an inactive gene for replace an active gene, or vice versa, is a portion of a gene delivery vehicle, confers a desired property to the cukaryotic cell, or encodes a therapeutic proteinaceous substance or a substance cornferring resistance for an antibiotic substance to a cell.

The method is useful for improving gene targeting efficiency. The method is useful for improving gene targeting efficiency. The method is useful for improving gene targeting efficiency. The method is useful for increase the quality of bulk products such as earth, or to increase the quality of bulk products such as earth, or to increase the production of specific secondary metabolites or to inhibit formation of unwanted metabolites, and also to inactive gene critical products on the flowers or that determine to the method is also useful for replacing and inactive gene flower pigments. The method is also useful for replacing with a poor cereponse to cancer therapy. By replacement of a defective p33 by an intact b3. Many tumours acquire a mutation in p53 during their capcapeutic cengonse to cancer therapy. By replacement of a defective p33 by an intact b3 through gene therapy, conventional anti cancer therapy have batter changes of succeeding. The method is also useful for therapeutic cengons to a pre-determined site present only in e.g. proliferating or present only in tumour cells, e.g. to the site where a tumour aniegance processed form. Abbaryage and expressed form. Abbaryage of s Indels 161; Length 1318; 7.0%; Score 105.5; DB 5; 18.4%; Pred. are useful in diagnosing or treating diseases and disorders, preferably neurodegenerative diseases. These may also be used as a drug target or in manufacturing a medicament for the treatment or prevention of the abovementioned diseases or disorders. The composition may also be used for treating cancer. This sequence represents one of the proteins of the complex of the invention.
